

Markdown & Media Cheat Sheet

An expanded reference guide featuring image embedding and video implementations.

This reference document contains the core elements of standard markdown along with specialized formatting techniques for handling images and rich multimedia files within an application environment.

1. Basic Typography & Headers

Markdown Syntax	Rendered Result
<code># Heading 1</code>	Heading 1
<code>## Heading 2</code>	Heading 2
<code>### Heading 3</code>	Heading 3

2. Text Emphasis

Markdown Syntax	Rendered Result
<code>*Italic text*</code>	<i>Italic text</i>
<code>**Bold text**</code>	Bold text
<code>~~Strikethrough~~</code>	Strikethrough

3. Working with Images

Images use a syntax identical to hyperlinks, but they require a preceding exclamation mark (`!`).

Standard Image Link

```
![Alt Text](https://example.com/image.jpg)
```

- **Alt Text:** The text within the brackets is read by screen readers or shown if the image fails to load.
- **URL/Path:** The text inside the parentheses is the target source path (can be a web link or local file path).

Image with Hover Tooltip

Add a quoted string at the end of the source URL to provide a hover message:

```
![App Interface](https://example.com/screenshot.png "Click to enlarge")
```

Advanced HTML Image Controls

Standard Markdown does not have options to specify image sizing or positioning. Users can drop standard HTML elements inside markdown files to accomplish this:

```
<!-- Sizing an image -->

<!-- Centering an image -->
<p align="center">
  
</p>
```

4. Embedding Videos

Standard Markdown **does not provide native video playback elements**. Depending on how your application outputs the markdown, users can employ the following strategies:

Method A: Clickable Thumbnail Image (Recommended)

This visually maps an image wrapper inside a valid hyperlink redirect. It mimics an embedded player, taking the user to YouTube/Vimeo upon interaction.

```
[![Watch Video](https://img.youtube.com/vi/VIDEO_ID/0.jpg)](https://www.youtube.com/watch?v=VIDEO_ID)
```

Method B: Native HTML5 Video

If your application supports raw HTML tags in its viewport renderer, users can embed direct local or streamed media codecs:

```
<video src="videos/tutorial.mp4" width="100%" controls>
  Your browser does not support the video playback feature.
</video>
```

Method C: Streaming Iframe Embed

For cloud video platform assets (YouTube/Vimeo shares), paste the provided platform iframe directly into the document:

```
<iframe width="560" height="315" src="https://www.youtube.com/embed/VIDEO_ID" frameborder="0"
allowfullscreen></iframe>
```

5. Hyperlinks & Lists

```
[Visit Website](https://google.com)
```

- Bullet item 1
- Bullet item 2
 - Indented sub-item

6. Code Snippets & Tables

```
```javascript
function greet() {
 console.log("Hello World");
}
```
```

| Item ID | Alignment Example | Price |
|---------|-------------------|--------|
| :--- | :---: | ---: |
| #001 | Centered Column | \$5.00 |
